Rick Chase
Fire Marshal
Pursuant to Section 101 of the International Fire Code, 2012 edition, with local amendments, the following specifications and regulations pertain to the design, construction and installation of built-in fire protection and life safety features required for buildings or property improvements.

These regulations include specifications based on requirements in the International Fire Code, National Fire Protection Association (NFPA) Standards and are intended to reduce ambiguities and confusion due to code interpretations.

These standards are only intended to cover the most frequently used items within the codes and may not be all inclusive. Items such as flammable liquids and hazardous material are so specific to the building or complex being constructed that the code must be referenced in order to determine specific requirements.

Rick Chase
Fire Marshal

Effective date: August 1, 1991
Updated: March 9, 1992
Updated: August 1, 1993
Revised: March 1, 1997
Revised: March 7, 2000
Revised: December 24, 2001
Revised/IFC July 8, 2004
Adopt 2003 IFC July 12, 2005
Adopt 2006 IFC January 1, 2008
Adopt 2012 IFC June 18, 2013
Revised: May 15, 2017
New Fee Schedule: March 1, 2019
The Central Arizona Fire and Medical Authority provides fire protection to an approximately 240 square mile area surrounding the greater Prescott area to include the following major areas:

- Town of Chino Valley
- Town of Dewey-Humboldt
- Town of Prescott Valley
- Paulden (areas within the Fire Authority)
- Unincorporated Prescott (within the Fire Authority)

The following subdivisions require automatic fire sprinklers regardless of square footage:

- American Ranch-(limited area on Callahan and Phantom Hill)
- Avalon Estates
- Chaparral Heights
- Creekside at Prescott
- Granite Mtn. Homesites
- Granite Park Ranch
- Meadow Ranch
- Mint Creek Ranch
- North Arrow Ranch
- Preserve at the Ranch
- Wagon Wheel Ranch

ADMINISTRATIVE RULES

The following rules, regulations and standards shall be observed in connection with all property improvements within the Central Arizona Fire and Medical Authority where fire protection facilities are required.

Applicable sections of the International Fire Code, 2012 Edition, are referenced at each section by the designation "Ref.:".

1.00 Definitions

The following definitions shall apply to these rules, regulations and standards:

a. "Approved" shall mean acceptable to the Fire Code Official of the Central Arizona Fire and Medical Authority.

b. "As-built plans" or "record documents" shall mean drawings, blueprints, sketches or similar renditions, drawn to scale, that accurately reflect the configurations of equipment or a system as it is installed on the premises.

c. "Fire access route" shall mean any approved road, street, alley, fire lane or similar roadway that is intended for use by Fire Authority apparatus.

d. "Fire Code Official" shall mean the Central Arizona Fire and Medical Authority Fire Chief or other designated authority charged with the administration and enforcement of the code, or a duly authorized representative.

e. "Fire flow" shall mean the quantity and duration of water flow required or available for fire protection in addition to the normal average domestic consumption in the same area.

f. "Fire protection system or equipment" shall mean any fire extinguishing system, fire sprinkler system, fire hydrants, fire detection or alarm system, commercial kitchen hood and duct ventilation system designed to detect, control, extinguish or prevent the spread of fire.

g. "GPM" shall mean a flow rate measured in gallons per minute.

h. "NFPA" shall mean the National Fire Protection Association.

i. "PSI" shall mean pressure measured in pounds per square inch.

j. "IBC" shall mean the latest edition of the International Building Code that has been adopted by the Town of Prescott Valley, Town of Dewey/Humboldt, Town of Chino Valley and/or Yavapai County.

k. "IFC" shall mean the 2012 Edition of the International Fire Code with local amendments that has been legally adopted by the Central Arizona Fire and Medical Authority.

l. "UL" shall mean Underwriters Laboratories.
k. "Underground Fire Line" shall mean the piping coming from the private or municipal water supply to the fire sprinkler riser or other sprinkler apparatus such as remote fire department connections, fire pump and tanks, etc.

1.01 Submission of Plans

1.01-1 Plans for property improvements shall be submitted in accordance with the rules, regulations, and policies of the planning and zoning or building department that has jurisdiction.

A minimum of three sets of building plans and specifications shall be reviewed by the Fire Authority for compliance with applicable codes and standards. The Fire Authority shall retain one set and the other two shall be returned to the building department having jurisdiction.

To assist developers, contractors, and/or property owners in designing practical and code compliant buildings, pre-construction meetings may be conducted during the design phase of a project. The purpose of these meetings shall be to clarify code requirements and to find solutions to possible construction problems. These meetings should be scheduled through the building department having jurisdiction.

Plans for built-in fire protection systems shall be submitted directly to the Fire Prevention Division of Central Arizona Fire and Medical Authority. These systems include automatic fire sprinklers, standpipes, fire detection and alarm systems, fire extinguishing systems, commercial kitchen suppression systems, and similar equipment designed to detect, control or prevent the spread of fire.

Plans for underground fire lines, remote fire department connections, and similar equipment designed to control or prevent the spread of fire shall be submitted directly to the Fire Prevention Division of Central Arizona Fire and Medical Authority.

1.01-2 Site plans for Fire Authority review shall include the following information:

a. Location and configuration of the proposed property improvement, showing its relationship to other buildings, property lines, nearest streets, roadways, alleys or Fire Authority access routes;

b. Location of existing underground water mains, the diameter of those water mains, fire hydrant locations;

c. Location, width, overhead obstructions and construction of all streets, roadways, alleys, bridges, fire lanes or Fire Authority access routes on the site to be improved;

d. Location of any temporary and/or permanent fences, walls, gates, arches, berms or any other security or ornamental features that may affect Fire Authority access to and/or on the site during construction and occupancy; and;

e. Location of any unusual or remarkable topographical features, landscaping, vegetation, or other features that may affect Fire Authority access to and/or on the site during construction and occupancy.

EXCEPTION: When a project developer has submitted a preliminary site plan for review by the Fire Code Official, the Fire Code Official may waive any or all of the above requirements.
1.01-3 When a site plan is not required for a building permit, the Fire Code Official shall be consulted regarding specifications for built-in fire protection facilities.

1.01-4 Plans and specifications (shop drawings and product data) for fixed fire protection systems, including but not limited to, automatic fire sprinkler systems, fire extinguishing systems, fire detection and alarm systems, commercial kitchen suppression systems, fire standpipe systems, underground fire lines, and fire pumps shall be submitted to the Fire Code Official for review and approval prior to installation.

Plans and specifications shall include at least the information specified in the appropriate chapters of these standards, and shall include specifications sheets and manufacturer’s catalog displays of all components of the fixed fire protection system and any calculations required.

1.01-5 Additions to an existing fire protection system in buildings requiring plans shall include the existing system in the plans for the new system.

1.02 Action for Approval by the Fire Code Official

1.02-1 All plans submitted to the Fire Code Official shall be approved, conditionally approved, or rejected.

When approving or conditionally approving a plan, the Fire Code Official shall forward a copy of the conditions to the Building Official and the project representative. A copy of the conditions shall be kept on file at the Fire Authority.

When rejecting a plan, the Fire Code Official shall forward a copy of the decision to the Building Official and project representative, setting forth the reasons for denial. A pre-construction meeting may be conducted to clarify code requirements.

1.03 Appeal Procedures

1.03-1 Any administrative decision relating to the requirements for fire protection may be appealed in accordance with the latest edition of the International Fire Code as amended by the Central Arizona Fire and Medical Authority.

Appeals of administrative decisions relating to requirements for fire protection shall be made in writing to the Central Arizona Fire and Medical Authority Board of Appeals or by calling 928-759-9933 and requesting that a variance request form be mailed or faxed to you. The Board of Appeals may be contacted at the following address:

Central Arizona Fire and Medical Authority Board of Appeals
Fire Prevention Division
8603 E. Eastridge Dr.
Prescott Valley, Arizona 86314
Telephone: (928) 772-7711
FAX: (928) 772-8800
1.04  **Inspections and Occupancy**  

1.04-1 The developer or contractor shall be responsible for notifying the Central Arizona Fire and Medical Authority Fire Prevention Division for inspection of all fire protection requirements. Unless unusual circumstances arise, the developer/contractor shall provide at least twenty-four (24) hours notice to the Fire Prevention Division to arrange an inspection.

In special cases, such as large or unusually complicated fire protection systems, the Fire Code Official may require more than twenty-four (24) hours notice to arrange an inspection.

1.04-2 If, when inspecting or witnessing a test of a fire protection system, the Fire Code Official observes a violation of the building code or construction standards, he or she shall promptly notify the Building Official and the contractor.

1.04-3 The Fire Code Official shall not approve the occupancy until he or she is satisfied that the requirements for fire protection have been met, and the actual construction of all fire protection equipment has been completed in accordance with the approved plan, accepted standards, or nationally recognized good practice.

1.04-4 When the Fire Code Official has been notified by the Building Official that a temporary or permanent Certificate of Occupancy has been or may be issued, he or she shall arrange to have the premises inspected for compliance with the conditions of the International Fire Code and its related standards.

If, at the time of this inspection, requirements specified during the plan review are not completed or other fire safety hazards are identified, the Fire Code Official shall issue a violation notice to the person responsible for the premises. This violation notice shall specify the necessary corrections and shall set forth a deadline for compliance.

1.05  **Required Permits and Fees**  

1.05-1 A permit shall be obtained from the Fire Prevention Division of the Central Arizona Fire and Medical Authority prior to commencing any work, activity or operation regulated by the fire code. Applicable permit fees shall also be required.

1.06  **Fee Schedule**  

**NEW FEE SCHEDULE EFFECTIVE MARCH 1, 2019**

1.06-1 **Plan Review Fees**

Chapter 2  
BUILDINGS UNDER CONSTRUCTION

2.00 Approved Plans  
Ref.: IFC 105

A complete set of Fire Authority approved plans, including plans for fire protection systems and underground fire lines, shall be available at the job site for review by the Fire Code Official at the time of the requested inspection.

A plan review fee for reviewing and inspecting fire protection systems and underground fire lines shall be charged. The plan review fee shall be paid at the time the plans are submitted for review. See Chapter 1, Section 1.06-1

2.01 Water Supply  
IFC Section 3312  
IFC Appendix B & C

2.01-1 A water source capable of supplying the required fire flow, either temporary or permanent, shall be made available prior to combustible materials being brought on to the construction site.

Temporary water supply arrangements shall have prior approval of the Fire Code Official. If a municipal or private water service is used, all connections shall have prior approval.

Fire hydrants shall be placed into service prior to combustible materials being brought on the building site or as soon as practical with the Fire Code Official’s approval.

Hydrants shall be maintained clear and accessible for fire protection equipment to meet requirements set forth in the plan review by the Fire Authority.

All fire hydrant installations must be approved and inspected by the Fire Authority and the appropriate water company having jurisdiction prior to use.

2.02 Access Roads  
Ref.: IFC 503

2.02-1 All weather access roadway for use of heavy firefighting apparatus shall be provided to the immediate job site at the start of construction.

The temporary fire access route shall be at least twenty (20) feet in width, shall have an unobstructed vertical clearance of at least thirteen feet, six inches (13’ 6”), and shall be capable of supporting the imposed load of fire apparatus weighing up to seventy-five thousand (75,000) pounds.

2.02-2 All temporary fire access routes, where required, shall be maintained until all construction is completed. Permanent fire apparatus access routes shall be completed prior to occupancy.

2.02-3 Arrangements shall be made to assure immediate Fire Authority access to the site at all times during construction. This may include signage as required by the fire code official.

2.03 Portable Fire Extinguishers  
Ref.: IFC 3315

2.03-1 A sufficient number of approved portable fire extinguishers, as specified by the Fire Code Official, shall be provided at the construction site.

The size, type and number of extinguishers shall be based on the relative hazards, the potential for fire spread, and the job site area.
2.03-2 When a construction site mobile office is provided, a minimum of one (1) portable fire extinguisher with a minimum UL classification of 2A-10BC shall be available at that location.

2.04 Fire Hazard Abatement  Ref.: IFC 3304

2.04-1 Excess debris, wrapping paper, wood packing materials, cardboard, insulation and other loose combustible materials shall not be allowed to accumulate inside any building under construction.

Debris that is removed from the building shall be piled or stacked not less than fifty (50) feet from the building or in an approved refuse container at least ten (10) feet from the building.

2.05 Flammable & Combustible Liquids Storage  Ref.: IFC 5706.2

2.05-1 Flammable or combustible liquid containers, and/or liquefied petroleum gas tanks or cylinders shall be removed from the building at the end of each working day, and stored in a secure, detached location away from the building.

**EXCEPTION:** Small containers where the total capacity of all containers does not exceed ten (10) gallons.

2.05-2 Temporary portable heating appliances shall be turned off at the end of each working day. Section 6103.2.1.2 and NFPA 58.

**EXCEPTION:** Heaters used for drying newly installed wallboard may be left on provided that all combustibles are located at least ten (10) feet from the unit, and fuel gas cylinders, if used, are adequately secured against tipping over. Heaters used shall be UL listed for this purpose.

2.06 Container & Portable Tank Storage Inside Buildings  Ref.: IFC 3305

2.06-1 Bulk flammable or combustible storage at construction sites shall be in accordance with the International Fire Code and shall meet the approval of the Fire Marshal.

2.06-2 Metal containers having a capacity of not more than sixty (60) gallons may be used for the storage of flammable and combustible liquids at construction sites.

Discharge devices shall not be of a type that develops internal pressure on the container. Pumping devices or approved self-closing faucets used for dispensing liquids shall not leak and shall be well maintained. Individual containers shall not be interconnected and shall be kept closed when not in use.

2.07 Temporary Tanks for Storage and Use of Flammable and Combustible Liquids  Ref.: IFC 5704

2.07-1 Aboveground temporary tanks of between sixty-one (61) and ten thousand (10,000) gallon capacity shall comply with IFC Chapter 57 and with the following:

a) Must go through the permit process with Fire Prevention, including fee.

b) Tanks shall be adequately safeguarded (fence, barrier posts per Code, etc.) from vehicular damage.

c) Tanks shall be adequately safeguarded from tampering when not in use.
d) Smoking or open flames within fifty (50) feet of any tank or product distribution point shall be prohibited.

e) Tanks and containers for the storage of flammable or combustible liquids aboveground shall be conspicuously marked with the product name and "FLAMMABLE - KEEP FIRE AND FLAME AWAY."

f) Tanks shall bear the marking "KEEP 50 FEET FROM BUILDING".

g) Flammable liquids such as gasoline shall not be dispensed by gravity. Dispensing shall be accomplished with an approved pumping device permanently attached to the tank. An effective anti-siphoning device shall be included in the pump discharge unless a self-closing nozzle is provided.

h) A 2A-20BC fire extinguisher shall be available within seventy-five (75) feet of the dispensing device.

i) Diking capable of containing the entire contents of the tank shall be provided around the tanks.

j) Temporary tanks shall be removed at completion of construction.

2.07-2 Temporary electrical wiring may be allowed as long as it is done in accordance with the National Electric Code, nationally recognized good practice, and approval of the Building Official or his or her designee.

2.07-3 Permit and fee will be required as specified in Chapter 1, Section 1.06.

2.08 **Control of Sources of Ignition**  
Ref.: IFC 3504

Open flame cutting, welding, brazing, or soldering operations shall be conducted with due care to prevent sparks or hot metal from starting fires.

The person performing the operation shall inspect the immediate area after work has stopped to see that no smoldering fires exist.

The person performing the operation shall have a fire extinguisher available nearby.

2.09 **Asphalt Kettles**  
Ref.: IFC 303

Asphalt kettles or trailers used in roofing operations shall comply with the following:

a) Asphalt kettles shall not be used inside of or on the roof of any building.

b) There shall be at least one approved 3A40BC fire extinguisher with a minimum UL classification of 40BC available within twenty five (25) feet of each asphalt kettle during such periods when the kettle is in use, and an additional 40BC extinguisher shall be available on the roof. Portable fire extinguishers shall remain unobstructed and clearly visible and maintained in an operable condition at all times.

(Note: Charged garden hoses shall not be used to meet this requirement.)

c) Asphalt kettles or trailers shall be located as far as practical from any combustible wall or overhang.
3.01 General Requirements

3.01-1 Every building hereafter constructed shall be accessible to Fire Authority apparatus by way of an approved access roadway with an all-weather driving surface capable of supporting the imposed load of fire apparatus weighing seventy five thousand (75,000) pounds.

**EXCEPTION:** When there is not more than two (2) Group R-3, or Group U occupancies, the requirements of this chapter may be modified; provided that, in the opinion of the Fire Code Official, firefighting or rescue operations would not be impaired.

Approved fire apparatus access roads shall be provided when any portion of an exterior wall of the first story of a building is located more than one hundred fifty (150) feet from Fire Authority vehicle access on a public street as measured by an unobstructed route around the exterior of the building.

More than one fire apparatus access road may be required when it is determined by the Fire Code Official that access by a single road may be impaired by vehicle congestion, condition of terrain, climatic conditions or other factors that could limit access.

Access roadway specifications may be modified if the building is protected by a complete automatic sprinkler system provided the sprinkler system is not otherwise required by the International Fire Code.

3.02 Minimum Specifications

3.02-1 Fire apparatus access roads shall be designed and installed to extend to within one hundred fifty (150) feet of all portions of the exterior walls of the first story of any building measured in a route around the exterior of the building.

3.02-2 Permanent fire apparatus access routes shall be constructed to meet the standards of the appropriate road department.

Temporary roads installed during building construction shall comply with the requirements of Chapter 2, Section 2.02 of these Standards.

3.02-3 Fire apparatus access roads shall be a minimum of twenty (20) feet in width, except as modified in Sections 3.03, 3.04 and 3.05 of these standards, and shall have a minimum vertical clearance of thirteen feet, six inches (13' 6").

3.02-4 Dead-end fire apparatus access roads shall be maintained permanently in an unobstructed manner, and shall be subject to frequent inspection by the Fire Authority. Removal of obstructing material shall be at the owner’s expense.

3.02-5 Fire apparatus access roads with a width of only twenty (20) feet shall be marked with permanent “NO PARKING -- FIRE LANE -- BY ORDER OF THE FIRE MARSHAL” signs. Signs shall measure twelve by eighteen (12x18) inches, have red letters on a white background, and shall comply with Federal Department of Transportation Standards for R8-31 signs as illustrated below:
Signs shall be installed at the entrance to the fire apparatus access route and at intervals determined by the Fire Code Official.

3.02-6 Fire apparatus access roads shall not exceed 12 percent grade. The fire code official may permit the access road grade to increase, but shall not exceed 15 percent if fire sprinkler protection is installed.

The angle of departure (break over angle) for road and driveway intersections or crossings shall not exceed twelve (12) degrees.

3.02-7 The minimum turning radii for all turns shall be twenty-eight (28) feet inside turning radius and fifty (50) feet outside turning radius.

3.03 Building Access for Ladder Operations

3.03-1 Buildings more than two (2) stories in height shall be designed in such a manner that access to the interior of the building can be accomplished from the same side of the building as the fire apparatus access route.

3.03-2 Buildings or portions of buildings exceeding thirty (30) feet in height from the lowest point of Fire Authority vehicle access shall be provided with a fire access route capable of accommodating Fire Authority aerial apparatus.

Access roadways required for ladder operations shall be a minimum of twenty-six (26) feet in width in the immediate vicinity of any building or portion of building more than thirty (30) feet in height above the lowest level of fire department vehicle access.

At least one of the required access roadways meeting this condition shall be located within a minimum of fifteen (15) and a maximum of thirty (30) feet from the building, and shall be positioned parallel to one entire side of the building, on the long side.

Note: The measurement for this requirement shall be taken from the exterior wall of the building to the nearest edge of the fire apparatus access road.
3.04 Dead-end Fire Apparatus Access Routes

3.04-1 Dead-end fire apparatus access roads shall meet the requirements of the following Table 3.04:

<table>
<thead>
<tr>
<th>LENGTH (feet)</th>
<th>WIDTH (feet)</th>

*Curves and topographical conditions may alter the requirements for turnarounds and the width of access roads.

3.04-2 The drawings in Appendix D of these standards illustrate approved fire apparatus access road turnarounds.

3.05 Permissible Modifications

3.05-1 When the building or buildings are outfitted with a complete automatic sprinkler system, the Fire Code Official may authorize modification of the full standard fire apparatus access road and/or turnarounds.

3.05-2 When the building or complex of buildings to be served is protected by a complete automatic sprinkler system, the access road may be greater than 150’ in length and the maximum length shall be determined by the Fire Code Official.

3.05-3 When proximity to property lines or other obstructions prevents the installation of cul-de-sacs or hammerheads on the end of a fire access route in excess of five hundred (500) feet in length, the Fire Code Official may allow multiple fire apparatus turnarounds along the fire access route.

3.06 Fire Hydrants Along Fire Apparatus Access Roads

3.06-1 An all-weather surface access to fire hydrants shall be maintained to accommodate the necessary firefighting apparatus.

3.06-2 Hydrant spacing and distribution along fire apparatus access roads shall be as specified in Chapter 6, Section 6.04 of these Standards.

3.07 Access to Individual Structures or Tenant Spaces

3.07-1 When a property within the Fire Authority is protected by an automatic fire alarm system or a fire sprinkler system, a KNOX key box approved by the Fire Code Official shall be installed on the property in a location approved by the Fire Marshal. Residential property shall be exempt from this requirement. Such boxes shall contain the following:

a) Keys to locked points of egress whether on the exterior or interior of the building.
b) The keys to any room in which the fire alarm panel or fire sprinkler system riser may be located.

c) Keys to other areas as directed by the Fire Marshal.

d) The keys that operate the elevator recall and emergency override systems.

e) When electronic locks are employed, the key box shall contain a copy of the appropriate codes that provide access.

**EXCEPTION:** Buildings that are staffed at all times by persons possessing keys to the areas specified in Section 3.07-1.

The Fire Marshal may specify more than one key box be installed on a building. Where factors require multiple key boxes or alternate locations, the Fire Marshal or designee shall specify those locations.

Key boxes may be purchased from an approved company as specified in Appendix I. If only one key box is required, it shall be installed adjacent to the main entrance. It shall be clearly visible and mounted at minimum height of five feet (5') from grade or a maximum height of six feet (6') from grade.

All keys shall be clearly marked to indicate the door, room, area or lock they serve.

3.08 **Access to Gated Communities, Gated Areas, and Mini-Storage Facilities**

3.08-1 All subdivisions, communities and mini-storage facilities and other facilities in the Central Arizona Fire and Medical Authority that install gates or other approved barricade methods to prevent and/or control access shall provide an approved Knox Key System for Fire Authority access. Gates shall be electric and shall be provided with approved preemption controls, a KNOX key switch and a manual release. The emergency key switch shall be mounted on a 5 ½ foot pedestal per Central Arizona Fire and Medical Authority specifications. See Appendix II for detail.

Key switches, padlocks, and boxes may be purchased from an approved company as specified in Appendix I.
Chapter 4
ADDRESSING

4.01  **Address and Premise Identification**

4.01-1 Approved address numbers shall be placed on all new and remodeled buildings, including one- and two-family dwellings, in such a position as to be plainly visible and legible from the road or street fronting the property.

  **Note:** Address assignments are made by the appropriate Planning and Zoning Departments.

4.01-2 Address numbers or letters shall face the street from which the building is addressed and shall be a minimum of six (6) inches in height and shall contrast with their background. The principal stroke of address numbers shall a minimum of one-half (1/2) inch. Numbers may be required to be larger as determined by the Fire Code Official.

When address numbers are located on clear glazing such as on doors or windows, the numbers shall be white to achieve contrast during all lighting conditions.

4.01-3 Where the building is not visible from the street or more than one building is on a site, such as a building on a long driveway or private roadway, provision shall be made to clearly identify which driveway or roadway serves the appropriate address at the entrance to the driveway or roadway.

4.01-4 Each suite or unit shall be separately identified and the unit numbers shall be a minimum of six (6) inches high and having a principal stroke of one-half (1/2) inch in width. The numbers shall be prominently displayed at the front and rear access doors. Numbers may be required to be larger as determined by the Fire Code Official.
Chapter 5
WATER SUPPLY AND FIRE FLOWS

5.01 General Specifications

5.01-1 Fire Authority hose connections and control valves used in connection with fire protection facilities shall be installed at locations and to the specifications approved by the Fire Code Official.

5.01-2 All required fire flows, either temporary or permanent, shall be available at a minimum residual pressure of twenty (20) psi.

5.01-3 Per amended Table B 105.1, any building or subdivision in the fire authority shall meet fire flows. The requirement may be met by fire hydrant(s), fire alarm system and/or fire sprinkler system. All buildings over 5,000 square feet require a fire sprinkler system.

EXCEPTION: Group R-3 less than 5000 square feet unless more than two stories above grade. The calculated area shall include all livable and unfinished space, the area of any attached garage, and concealed or accessible spaces intended for storage use and/or future living space. All attached roofs and overhangs greater than 4 foot in width are included in the calculated area.

5.02 Quantity

5.02-1 The required quantity of water shall be equal to the calculated fire flow for the greatest hazard or protected risk in the proposed development, and shall be based on a minimum demand as required by Table B 105.1.

5.02-2 Where the existing fire flow on a system is inadequate, or a new system is proposed, engineering design calculations to verify fire flow availability shall be provided to the Fire Authority by the developer.

5.02-3 Required fire flow for buildings shall be determined by the Fire Code Official using Table B 105.1.
TABLE B105.1 - MINIMUM REQUIRED FIRE FLOW AND FLOW DURATION FOR BUILDINGS a

</tbody>
</table>

For SI: 1 square foot = 0.0929 m², 1 gallon per minute = 3.785 L/min, 1 pound per square inch = 6.895 kPa.

a. Types of construction are based on the International Building Code.
b. Measured at 20 psi residual pressure.
c. Added

Note 1 For fire areas that are between the ranges listed on this Table, the fire flow shall be averaged between the low and high number.

Note 2 In Types IA and IB construction, only the three largest successive floor areas shall be used.

Note 3 For buildings protected by approved sprinkler systems, see Section 5.04.

5.02-4 Area separation walls, without openings designed and constructed in compliance with the IFC shall be considered as dividing a building into separate fire areas for the purpose of determining required fire flow that is available for fire fighting. See Appendix B, Section B102 Definitions and Section B104.2 Area Separation.
5.02-5 The minimum required fire flow for any newly developed area shall be as follows:

- One- and two-family unit developments: 1000 gpm*
- Commercial developments: 1000 gpm*

*Gallons per minute at twenty (20) psi for a two (2) hour duration.

Exception: Water systems in commercial developments unable to supply minimum requirements may request a variance from the Fire Code Official.

Exception: The Fire Code Official may allow fire flows in isolated residential developments to be met by requiring fire sprinklers in all buildings and residences when fire flows cannot be met by water storage and fire hydrants.

Note: The required fire flow for any one building or occupancy within that area may exceed these minimums. Care should be taken in designing the water supply system to meet the anticipated demand specified by the Table in Section 5.02-3.

5.02-6 The delivery of the required fire flow by private water systems is permissible, provided that:

The system shall be designed and engineered to meet the required fire flows as established by the Fire Code Official. Engineering calculations to verify the anticipated flows shall be submitted at the time of plan review.

b) Provisions shall be made to keep reservoirs and tanks full and in a ready condition at all times utilizing a float system and back up generators.

c) The water supply shall be capable of delivering the required fire flow as required by the Table in Section 5.02-3.

5.03 Modifications Ref.: IFC B103 & Table B105.1

5.03-1 Required fire flows may be modified upward where conditions indicate an unusual susceptibility to group fires or conflagrations or as specified below.

Fire-flow requirements may be modified downward for an isolated building or group of buildings in rural areas or in small communities where the development of full fire flow requirements is impractical.

5.03-2 After the modifications as specified in this section have been computed, refer to Sections 5.04 and 5.05 for permissible modifications based on the installation of automatic fire sprinkler and/or automatic smoke detection systems.
Chapter 6
FIRE HYDRANTS

6.01 General Specifications

6.01-1 Fire hydrants shall be installed in accordance with the Fire Authority and the local water company requirements.

6.01-2 Fire hydrant placement and quantity shall be determined by the Fire Code Official.

6.02 Protection

6.02-1 When required by the Fire Code Official, fire hydrants that are exposed to vehicular damage shall be protected by appropriate guard posts or other approved means. Acceptable protection shall consist of guard posts installed in the following manner:

1. Guard posts shall be constructed of steel not less than four (4) inches in diameter and shall be concrete filled.

2. Guard posts shall be set not less than three (3) feet deep in a concrete footing of not less than a fifteen (15) inch diameter.

3. Guard posts shall be set with the top of the posts not less than three (3) feet above ground.

4. Guard posts shall be located a minimum of three (3) feet from the hydrant and shall be located no more than four (4) feet apart.

5. Guard posts shall not interfere with the use or operation of the fire hydrant. The number of posts provided shall be sufficient to adequately protect the hydrant.

6.03 Marking and Clearance

6.03-1 When required by the Fire Code Official, paved areas within the vicinity of a hydrant shall be permanently marked by painting the curb red, striping, or signage.

When special circumstances occur, the Fire Code Official may specify a minimum "NO PARKING" perimeter to be permanently marked around a hydrant.

6.04 Hydrant Spacing and Distribution

6.04-1 Fire hydrants shall be installed per fire flow and spacing requirements specified for the type of development and in accordance with Table C105.1 unless otherwise modified by the Chief or designee:
TABLE C105.1

</table>

For SI: 1 foot = 304.8 mm, 1 gallon per minute = 3.785 L/m.

a. Reduce by 100 feet for dead-end streets or roads.
b. Where streets are provided with median dividers which can be crossed by fire fighters pulling hose lines, or where arterial streets are provided with four or more traffic lanes and have a traffic count of more than 30,000 vehicles per day, hydrant spacing shall average 500 feet on each side of the street and be arranged on an alternating basis up to a fire-flow requirement of 7,000 gallons per minute and 400 feet for higher fire-flow requirements.
c. Where new water mains are extended along streets where hydrants are not needed for protection of structures or similar fire problems, fire hydrants shall be provided at spacing not to exceed 1,000 feet to provide for transportation hazards.
d. Reduce by 50 feet for dead-end streets or roads.
e. One hydrant for each 1,000 gallons per minute or fraction thereof.

6.05 Fire Hydrants Along Parkways and Arterials

6.05-1 Notwithstanding the hydrant spacing requirements of this chapter, when a project site is located across a parkway or primary arterial, hydrants shall be located on the same side of the parkway or arterial as the project if required by the Fire Code Official.

6.06 Private Fire Hydrants

Private fire hydrants shall be installed and maintained according to the Central Arizona Fire And Medical Authority, National Fire Protection Association Standard (NFPA) 24, and the local water company.
Chapter 7
AUTOMATIC FIRE SPRINKLER AND STANDPIPE SYSTEMS

7.01 Standards Established

7.01-1 All automatic fire sprinkler systems and standpipe systems shall be designed, installed, and tested in compliance with the 2012 International Fire Code with local amendments, the current editions of the appropriate NFPA Standards; and as specified in the following subsections of this standard.

7.01-2 Appropriate provisions shall be made to prevent contamination of potable water supplies by installing appropriate devices on the fire protection service line as required and approved by the local water company having jurisdiction.

7.01-3 Automatic sprinkler systems are required in the following occupancies:

Group A occupancies:

1. Any Group A occupancy 5,000 square feet and above.
3. Amusement buildings as required in the IFC.
4. Any other Group A occupancy that exceeds two stories in height.
5. Any Group A2 occupancy with an occupant load of 100 or more.
6. Any Group A1, A3, A4 with an occupancy load of 300 or more.
7. The fire area is located on a floor other than the level of exit discharge.

Group B occupancies:

1. All Group B occupancies 5,000 square feet and above total floor area or exceed two stories in height.

Group E occupancies:

1. All Group E occupancies.
   Exception 1: A daycare with less than 11 children in a private residence.
   Exception 2: In group E occupancies less than 5,000 s.f. where a municipal water supply is not available, if every classroom has at least one exterior exit door at ground level and an NFPA 72 compliant automatic fire alarm system installed throughout, fire sprinklers may be omitted if approved by the fire code official.

Group F occupancies:

1. All woodworking facilities 2,500 square feet and above that generate finely divided waste or combustible materials.
2. Any other Group F 5,000 square feet and above total floor area or exceeds two stories in height.
3. Any Group F-1 occupancies used for manufacture of upholstered furniture or mattresses exceeding 2,500 square feet.

Group H occupancies:

1. All Group H occupancies.
Group I occupancies:

1. In all Group I occupancies.
2. An automatic sprinkler system is not required where day care facilities are at the level of exit discharge, where every room where care is provided has a least one exterior exit door and where the fire area is less than 5,000 square feet.
3. In buildings where Group I-4 day care is provided on levels other than the level of exit discharge, an automatic fire sprinkler system shall be installed through all levels of the building.

Group M occupancies:

1. In all Group M occupancies 5,000 square feet or greater total floor area or exceeds two stories in height. The area of mezzanines shall be included in determining square footage.
2. In all Group M occupancies where storage of merchandise is in high-piled or rack storage arrays.

Group R occupancies:

1. All Group R occupancies.
   Exceptions:
   1. Group R-3 less than 5,000 square feet unless more than two stories above grade. The calculated area shall include all livable and unfinished space, the area of any attached garage, and concealed or accessible spaces intended for storage use and/or future living space. All attached roofs and overhangs greater than 4 feet in width are included in the calculated area.
   2. Group R-3 care facilities within a dwelling unit for five or fewer persons.

Group S occupancies:

1. Any Group S occupancy 5,000 square feet or greater total floor area or exceeds two stories in height.
3. Any group S occupancy where storage is in high-piled or rack storage arrays.

7.01-4 Automatic sprinkler systems are required in the following existing occupancies:

   Ref.: IFC 1103

1. Building Addition. A sprinkler system is required when any addition increases the total floor area to 5,000 square feet or greater.
   Exception: R-3 Occupancies.

2. Change of Use. A sprinkler system is required when any change of use or occupancy occurs to a portion of the building to a more hazardous occupancy or as determined by the Fire Code Official.

3. Group A-1, A-3, and A-4 Addition. A sprinkler system is required throughout the building when any addition to existing assembly occupancies increases the occupant load to more than 300.
4. **Group A-2 Addition.** A sprinkler system is required throughout the building when any addition to existing assembly occupancies increases the occupant load to more than 100.

5. **Group R-3 Care Facilities.** A sprinkler system is required throughout the building in a single-family residence wherein six or more persons receive care.

6. **Vacant Buildings.** A sprinkler system is required throughout the building when any A, E, or I occupancy that has been vacant for more than 18 months requests to resume as the same occupancy classification.

7. **Fire Wall Breech.** A sprinkler system is required throughout the building when any modification or alteration to an existing building, with a total floor area of 5,000 square feet or greater, breeches or removes a required fire rated wall assembly.

### 7.02 Submission of Plans

**Ref.: IFC 901**

7.02-1 Plans for all sprinkler and standpipe systems shall be submitted for review as specified in Chapter 1, Section 1.01-4 of these standards and shall include the information specified in this chapter.

Fire sprinkler plans and hydraulic calculations shall require an engineer’s stamp of approval or a minimum NICET Level III stamp of approval prior to being submitted for review.

**Exception:**
1. Fire Sprinkler Plans for high-piled combustible storage occupancies shall require a registered fire protection engineer stamp
2. High-piled storage occupancies shall submit a plan showing the location of the different classifications of commodities.
3. High-piled storage areas shall require identification of High Piled Storage Sprinkler System Capabilities and Limitations. (Contact CAFMA for labeling requirements.)

7.02-2 A plan review fee shall be applied for reviewing all fire protection systems. The plan review fee shall be paid at the time the plans are submitted for review.

### 7.03 General Requirements

**Ref.: IFC 901 & NFPA**

7.03-1 Fire sprinkler systems, standpipe systems, and underground piping shall only be installed by trained, qualified, and certified contractors.

7.03-2 All equipment, devices, piping, fittings, etc. shall be listed or approved by Underwriters Laboratories, Underwriters Laboratories Canada, Canadian Standards Association and/or Factory Mutual and shall be approved for the purpose for which they are intended. No person shall perform any type of modification to any system which would void its listing.

7.03-3 The International Fire Code requires that Fire Department Connections be maintained in an operative condition at all times. Fire Department Connections shall be required by the Fire Marshal to have a locking cap on the connection. Existing Fire Department Connections with continual tampering problems may also be required to have locking caps. See IFC 912.

Locking caps may be purchased through an approved company as specified in Appendix I.
7.03-4 The International Fire Code requires that all fire hydrant systems, fire-extinguishing systems (including automatic sprinklers), wet and dry standpipes, basement inlet pipes and other fire-protection systems and appurtenances thereto shall meet the approval of the Fire Authority as to installation and location and shall be subject to such periodic tests as required by the Chief or designee. **Plans and specifications shall be submitted to the Fire Authority for review and approval prior to installation.**

7.04 **Required Plan Submittal Information**

The following information shall be included on all working plans submitted to the Fire Authority for review.

7.04-1 **Underground Piping**

Underground piping systems shall be designed and installed according to the current edition of NFPA 24. Plans shall be submitted for approval prior to installation. A site plan shall be approved by the authority having jurisdiction in every case where new private fire service mains are contemplated.

The plan shall be drawn to scale and shall include all essential details including, but not limited to:

1. Business or building owner name.
2. Job site address.
3. Size and location of water source.
4. Size and location of all underground piping.
5. Size, type, and location of valves, meters, and regulators.
6. Size and location of hydrants, showing size and number of outlets.
7. Sprinkler and standpipe risers to be supplied with the system.
8. Location of fire department connections.
9. Thrust blocks (kickers) locations.
10. Plan review fee per current fee schedule.

A visual inspection and pressure test shall be required prior to covering the underground line. Full orifice flushing of the pipe is also required and shall be witnessed by Central Arizona Fire And Medical Authority prior to acceptance. NFPA "Contractor's Material and Test Certificate for Underground Piping" certificates shall be submitted to Central Arizona Fire And Medical Authority for the underground piping upon completion of the underground piping inspection, 200-psi test, and flushing of the piping.

7.04-2 **Sprinkler Systems**

Sprinkler systems shall be designed and installed according to the current edition of NFPA 13, 13D, or 13R.

The plan shall be drawn to scale and shall include all essential details including, but not limited to:

1. Business or building owner name.
2. Job site address.
3. Ceiling construction.
4. Full height cross section of building.
5. Location of fire walls.
6. Location of partitions.
7. Intended occupancy of each area or room.
8. Any questionable small enclosures in which no sprinklers are installed.
9. Size of city water main and current flow test results.
10. Other sources of water supply, with pressure or elevation.
11. Make, type and nominal orifice size of sprinklers.
12. Temperature rating and location of high temperature sprinklers.
13. Total area protected by each system on each floor.
14. Number of sprinklers on each riser per floor.
15. Make, type, model and size of alarm or dry-pipe valve.
16. Make, type, model and size of pre-action or deluge valve.
17. Type and location of alarm bells.
18. Total number of sprinklers on each dry-pipe system, pre-action system, combined dry-pipe/pre-action system or deluge system.
19. Approximate capacity in gallons of dry-pipe systems.
20. Pipe material type and schedule of wall thickness.
21. Nominal pipe size and center-to-center pipe length dimensions.
22. Type and locations of hangers and sleeves.
23. All control valves, check valves, drains, and test valve connections.
24. Size and locations of hand hose outlets and related equipment.
25. Underground pipe size, length, location, material and point of connection to city main; type of valves and meters. (Unless previously submitted and approved).
26. Provision for flushing the sprinkler system.
27. When the equipment is to be installed as an addition to an existing system, the existing system shall be indicated on the plans to make all conditions clear.
28. For hydraulically designed systems, the materials used are to be included on the hydraulic data nameplate.
29. Contractor’s name, address, telephone number, and license number.
30. Details of freeze protection.
31. Design area.
32. Remote Inspectors test valve.
33. Specification sheets for all devices.
34. Engineer’s stamp or NICET Level III certification. See section 7.05
35. Plan review fee per current fee schedule.

Hydraulic calculation summary sheets must contain the minimum following information, when applicable:

1. Date.
2. Location.
3. Name of owner and occupant.
4. Building number or other identification.
5. Description of hazard.
6. Name and address of contractor or designer.
7. Name of approving agency.

8. System design requirements.
   a. Design area of water application in square feet.
   b. Minimum rate of water application (density) in gpm per square foot.
   c. Area per sprinkler in square feet.

9. Total water requirements as calculated including allowance for inside hose and outside hydrants.

Hydraulic calculation worksheets must contain the following information:

1. Sheet number.
2. Sprinkler description and discharge constant (K).
5. Pipe size.
6. Pipe lengths, center-to-center of fittings.
7. Equivalent pipe lengths for fittings and devices.
8. Friction loss in psi per foot of pipe.
10. Elevation head in psi between reference points.
11. Required pressure in psi at each reference.
12. Velocity pressure and normal pressure if included in calculations.
13. Notes to indicate starting points, reference to other sheets, or to clarify data shown.
14. Sketch to accompany gridded system calculations to indicate flow quantities and directions for lines with sprinklers operating in remote area.

7.05 Design Requirements

The Arizona Board of Technical Registration has reaffirmed its decision that the design of fire protection systems constitutes the practice of engineering and will require all sprinkler plans to bear the seal of an Arizona State registered engineer or architect.

1. Engineer’s/Architects Seal
2. A minimum NICET Level III may design and stamp the plans and shall provide their certification.

7.06 Final Approval of System Ref.: IFC 901

1. Provide all NFPA contractor material and test certificates.
2. Provide a set of “As-Built” plans and calculations (if needed) for all changes made in the system during construction prior to asking for a final inspection.
3. Conduct and pass all appropriate flow and alarm tests.

7.07 Fire Department Connections (FDC) Ref.: IFC 912 NFPA 13

7.07-1 The fire department connection (FDC) shall be outfitted with two and one-half inch (2-1/2”) female couplings with National Standard threads or as required by NFPA.

The FDC shall be arranged to face the street, driveway or fire access route as specified by the Fire Code Official. A working space of not less than 36 inches in width, 36 inches in depth and 78 inches in height shall be provided and maintained in front of and around FDC.

Fire department connections shall be arranged so the lowest point on the inlet connection is between twenty-four (24) and forty-two (42) inches above finished grade at its location.

Locking FDC caps shall be required. IFC Section 912.3.1

7.07-2 Fire department connections shall not be located more than one hundred (100) feet from the access roadway. An alarm bell shall be located above the FDC whenever practical, as well as signage noting “Fire Department Connection” or “FDC”.

7.07-3 Where fire department hose connections are subject to obstruction or vehicular damage, they shall be protected by guard posts as follows:

1. Guard posts shall be constructed of steel pipe not less than four (4) inches in diameter and shall be concrete filled.
2. Guard posts shall be set not less than three (3) feet deep in a concrete footing of not less than a fifteen (15) inch diameter.

3. Guard posts shall be set with the top of the posts not less than three (3) feet above ground.

4. Guard posts shall be located a minimum of three (3) feet from the fire department hose connection and shall not interfere with operation of the threaded swivel connections. The number of posts provided shall be sufficient to protect the hose connection

5. Guard posts shall be spaced no more than four (4) feet apart.

7.07-4 All fire department hose connections shall be outfitted with a clapper or check valve for each hose connection.

7.07-5 The size of the fire department connection for supply shall be equal to the size of the sprinkler or standpipe riser to a maximum six (6) inch diameter.

7.07.6 When a building is served by multiple fire department connections, each connection shall be provided with an approved sign detailing the area of the building served by each connection.

On buildings or structures with multiple risers supplied by a single main, the size of the fire department hose connection for supply shall be equal to the largest riser to a maximum six (6) inch diameter.

**EXCEPTION 2:** Sprinkler systems in one- and two-family dwellings installed under the provisions of NFPA Standard 13D shall be installed as specified in that standard as a minimum.

7.08 **Control Valve Signage**

7.08-1 When the sprinkler or wet standpipe system riser is located in a room, closet or other enclosed space, the outside of the door shall have a sign that reads "Fire Sprinkler Control" or "Standpipe Control." Letters shall be at least one (1) inch in height and shall contrast to their background.

7.09 **Dry Pipe Performance**

7.09-1 Regardless of system piping capacity, dry pipe sprinkler systems shall be capable of delivering water to the inspector's test valve within sixty (60) seconds of the valve being opened. Approved quick opening devices may be used to meet this requirement.

7.10 **Hydraulically Engineered Sprinkler Systems**

7.10-1 It is recommended that hydraulically engineered systems have a minimum of a ten (10) percent safety factor calculated into the system.
7.11 Sprinkler System Supervision

7.11-1 Automatic sprinkler systems having more than twenty (20) sprinklers shall be supervised in an approved manner for water flow and against tampering. Tamper signals shall transmit a distinct alarm or zone.

7.11-2 Tamper security switches shall be installed on all main and auxiliary controlling valves located in a building or outdoors.

**EXCEPTION:** Control valves located outside a building and in an underground vault or pit need not be electronically supervised provided they are locked in the "open" position in a manner approved by the Fire Code Official. See Section 7.12-4.

7.11-3 See Chapter 8, Section 8.03-4 of these Standards for requirements pertaining to the fire alarm control panel.

7.11-4 When electronic supervision is not required, valves may be supervised by one of the following methods:

a. Locking the valves open with 3/15-inch plated or galvanized chain or 5/16-inch 7x19 stainless or galvanized wire rope. The chain or wire rope shall be threaded through the valve wheels so they may not turn more than one-quarter (1/4). Chain or wire rope shall be locked with a padlock.

b. Sealing valves in the open position with approved weekly recorded inspections when the valves are within locked enclosures.

7.12 Fire Riser Rooms

7.12-1 Fire riser rooms shall have an access door to the exterior of the building and signage on the door designating Fire Riser Room.
Chapter 8
FIRE DETECTION AND ALARM SYSTEMS

8.01 Standards Established

8.01-1 All automatic and manual fire detection and alarm systems shall be designed, installed, tested and maintained as specified in the 2012 International Fire Code with local amendments, the 2012 International Fire Code Standards, NFPA Standard 72, and as specified in the following subsections of these standards.

8.01-2 Automatic fire alarm systems are required in all occupancies protected by an automatic fire sprinkler system and as required for other special uses and conditions in IFC 907. Exception: R-3 single-family homes.

8.02 Submission of Plans

8.02-1 Plans for all fire detection and alarm systems shall be submitted for review as specified in Chapter 1, Section 1.01-4 of these standards and shall include the information specified in this chapter.

8.02-2 Tenant Improvements. Three sets of fire alarm plans, manufacturer specifications, and battery calculations shall be provided to Central Arizona Fire and Medical Authority prior to installation. Regardless of the amount of devices added or relocated a final acceptance test shall be required by the Central Arizona Fire and Medical Authority.

8.02-3 A plan review fee shall be charged for reviewing fire alarm systems. The plan review fee shall be paid at the time the plans are submitted for review. The plans shall be stamped by a minimum of Nicet Level III or an Engineer.

8.03 General Requirements

8.03-1 Fire alarm systems shall only be installed by trained and qualified fire alarm installers with a minimum level Nicet II supervising the installation.

8.03-2 All equipment, devices, and wiring shall be listed or approved by Underwriters Laboratories, Underwriters Laboratories Canada, Canadian Standards Association and/or Factory Mutual and shall be approved for the purpose for which they are intended. No person shall perform any type of modification to any device which would void its listing.

8.03-3 All wiring shall be done in compliance with the National Electrical Code, pertaining to Fire Alarm Signaling Circuits, and any other applicable article of that code.

8.03-4 The fire alarm control panel, trouble signal indicators, or remote annunciator shall be installed in areas which are normally staffed during the hours the building is occupied.

8.03-5 The International Fire Code requires that all fire alarm systems and appurtenances thereto shall meet the approval of the Fire Authority as to installation and location and shall be subject to such periodic tests as required by the Chief. Plans and specifications shall be submitted to the Fire Authority for review and approval prior to installation.
The following minimum information shall be required to be included with all drawings submitted to the Fire Authority for review.

1. Job site address and company name.
2. Owner and address of protected structure.
3. Name of designer, license number and/or NICET Certification, and telephone number.
4. Name of installing company, contact person, license number and/or NICET Certification, and telephone number.
5. Monitoring company name and telephone number.
6. Type of building construction, square footage and occupancy.
7. The type of fire alarm system to be provided. (Class A, B, addressable, analog, local, proprietary, etc.)
8. Calculations (e.g., secondary supply and voltage drop calculations)
9. A complete list of detection, evacuation signaling, and annunciator zones.
10. List specifications on (or provide specification sheets)
   a) All appliances/devices
   b) Control panels, system components, modules, relays, and remote annunciators
   c) Wiring and battery
   d) All system components shall be listed and found suitable for intended use.
11. Operating instructions for the system (copy of what will posted at the FACP)
12. Compatibility listings.
13. Manufacturer’s inspections instructions – NFPA 72 Chapter 7
14. Applicable Codes and Standards used in the system design.
15. Any other information, which is required to comply with the applicable codes, standards, and other design criteria.
16. Plan review fee per current fee schedule
17. A floor plan that indicates the use of all rooms.
19. Locations of alarm notification appliances, including cadela ratings for visible alarm notification appliances.
20. Location of fire alarm control unit, transponders and notification power supplies.
22. Power connection.
23. Battery calculations.
24. Conductor type and sizes.
25. Voltage drop calculations
26. Manufacturers’ data sheets indicating model numbers and listing information for equipment, devices and materials.
27. Details of ceiling height and construction.
28. The interface of fire safety control functions.
29. Classification of the supervising station.

Required Drawings:

1. All sheets to be the same size (Recommended 24 x 16)
2. Drawings to be to scale
3. Cut of structure to indicate room height, etc.
4. Ceiling details and configurations
5. Circuit Wiring Diagram
6. Sequence of operation
7. Floor plan of the entire building, including all floors and areas.
8. Show all devices and appliances
   (a) Smoke detectors  (f) Flow switches
   (b) Heat detectors  (g) Tamper switches
   (c) Duct detectors  (h) Horns/Strobes
   (d) Pull stations  (i) Control panel
   (e) Door closures  (j) Remote annunciator
   (k) Other extinguishing systems
9. Show detector spacing and locations
10. Show notification device spacing & locations
11. Wiring legend
12. Symbol list
13. Any other information, which is required to comply with the applicable codes, standards, and other design criteria.

8.05  System Monitoring  Ref.: IFC 907

8.05-1 All required fire alarm systems shall be supervised by an approved central, proprietary or remote station service or a local alarm which will give an audible signal at a constantly attended location.

8.05-2 A dedicated phone line shall be required for all systems.

8.06  Fire Alarms for Existing Buildings  Ref.: IFC 1103.7 Amended

8.06-1 Non-Monitored Sprinkler System  A fire alarm system shall be installed throughout the building when an existing, non-monitored fire sprinkler system is modified by 20 or more heads.

8.06-2 Newly Installed Sprinkler System  A fire sprinkler system is required to be installed when an existing building is retrofitted with a fire sprinkler system per requirements in IFC 1103.5 Amended.
Chapter 9
ABOVEGROUND FUEL TANK INSTALLATIONS

9.01 General

9.01-1 All aboveground fuel tanks used for storing and dispensing flammable or combustible motor vehicle fuels shall be designed, installed, and tested by the Fire Prevention Division of the Central Arizona Fire and Medical Authority according to the 2012 International Fire Code and as specified in the following subsections of this standard.

9.01-2 The contractor or property owner proposing the installation of aboveground fuel tanks shall check with the appropriate planning and zoning department to determine if the local zoning laws allow aboveground fuel tanks at the proposed site.

NOTE: Underground Fuel Storage and Dispensing: Any plans for underground fuel tanks used for storing and dispensing flammable or combustible motor vehicles fuels shall be submitted to both the Arizona Department of Environmental Quality (ADEQ) and the Fire Prevention Division of the Central Arizona Fire and Medical Authority as the Central Arizona Fire And Medical Authority has jurisdiction over all aboveground piping and devices.

9.02 Submission of Plans

9.02-1 Plans shall be submitted with above ground fuel tank permit to the Fire Prevention Division for the installation, operation, repair, or modification of aboveground fuel tanks used for storage and dispensing of flammable or combustible liquid motor fuels.

9.02-2 A plan review fee shall be charged for reviewing fuel tank installations and modifications. The plan review fee shall be paid at the time the plans are submitted for review.

9.02-3 Plans shall be submitted for approval prior to installation. The plans shall be drawn to scale and shall include all essential details, including but not limited to:

- Business owner’s name, address, and telephone number.
- Job site address.
- Contractor’s name, address, and telephone number.
- Types and quantities of liquids to be stored or dispensed.
- Method of storage and dispensing.
- Overfill prevention method.
- Spill containment method.
- Specification sheets for all tanks, equipment, piping, and appliances used in the installation.
- Site plan indicating:
  - Vehicle access
  - Aboveground tank location(s).
  - Vehicle impact protection for tanks & dispensers.
  - Emergency controls location.
  - Distances from tanks and/or dispensers to property lines, buildings, and ignition sources.
  - Secondary containment.
  - Other aboveground or below ground flammable or combustible liquids tanks, LP-gas or CNG storage vessels.
  - Fire suppression appliances or equipment.
  - Electrical system.
- Above and below grade piping, to include dispensing devices and filling devices.
- Signage
- Overfill protection
- Venting
- Other information as required by the Fire Marshal.
Chapter 10
MISCELLANEOUS STANDARDS

10.01 Standards Established Ref.: IFC 901

All fixed fire extinguishing systems, other than sprinkler or standpipe systems as specified elsewhere in these standards, shall be designed, installed, tested, and maintained in compliance with the appropriate NFPA standard for that type of system.

10.02 Protection of Fuel Gas Equipment Ref.: IFC 312

10.02-1 When exposed to probable vehicular damage due to proximity to alleys, driveways, or parking areas, aboveground gas tanks, meters, regulators and piping shall be suitably protected. Acceptable protection shall consist of guard posts installed in the following manner:

1. Guard posts shall be constructed of steel not less than four (4) inches in diameter and shall be concrete filled.
2. Guard posts shall be set not less than three (3) feet deep in a concrete footing of not less than a fifteen (15) inch diameter.
3. Guard posts shall be set with the top of the posts not less than three (3) feet above ground.
4. Guard posts shall be located a minimum of three (3) feet from the hydrant and shall be located no more than four (4) feet apart.
5. Guard posts shall not interfere with the use or operation of the fire hydrant. The number of posts provided shall be sufficient to adequately protect the hydrant.

Other methods that will provide equivalent protection may be submitted for review and approval by the Fire Marshal.

10.02-2 Where fuel gas piping and equipment is protected in a means acceptable to the fuel gas utility company, that method may be considered acceptable to the Fire Code Official.

10.03 Spray Booth Construction Ref.: IFC Section 2404

10.03-1 Unlisted, site-built spray booths shall be constructed of non-combustible materials in compliance with the International Fire Code. Plans shall be submitted to and approved by the Fire Marshal prior to construction. Electrical and mechanical components of spray booths shall be approved by the appropriate building department prior to construction.

10.03-2 A plan review fee shall be charged for reviewing spray booths. The plan review fee shall be paid at the time the plans are submitted for review.

10.04 Occupant Load Signs Ref.: IFC 1004

10.04-1 Where a building or place of assembly is required to have its occupant capacity posted for public view, the sign shall consist of letters and numbers at least one (1) inch in height which contrasts to their background.
10.04-2 The occupant capacity sign shall be designed as follows:

![Maximum Occupancy Sign]

If applicable, a dual use occupant load sign may be installed. It shall be designed as follows:

![Maximum Occupancy or Load Sign]

10.04-3 The sign shall be permanently located in the building or in each separate room adjacent to the main entrance and shall remain visible at all times.

10.05 No Smoking Signs

10.05-1 When required by the Fire Code Official, permanent "NO SMOKING" signs shall be prominently displayed in all areas where smoking is prohibited.

10.05-2 "NO SMOKING" signs shall consist of letters at least five (5) inches in height that contrast to their background.

10.06 Commercial Kitchen Hood Extinguishing Systems

10.06-1 General

Commercial kitchen hood extinguishing systems installed within the Fire Authority shall comply with the UL 300 Standard. Systems not in compliance with this standard shall be prohibited from being installed, modified, expanded, or moved into a building within the Fire Authority.

A Class K fire extinguisher is required for all new commercial kitchen systems.

Pre-existing, non-compliant kitchen hood extinguishing systems that are serviceable shall be allowed to continue provided that the systems are not modified, expanded, or moved.

On site inspection by Central Arizona Fire and Medical Authority is required for approval of the hood system.
**10.06-2 Plan Review Fees**

A plan review fee shall be charged for reviewing kitchen hood extinguishing systems. The plan review fee shall be paid at the time the plans are submitted for review.

**10.06-3 Submittal Information**

The following information shall be included on all working plans submitted for review.

**General Information**

1. Name of project owner and occupant.
2. Job site address.
3. Full height cross-section.
4. All plans shall bear a clearly marked scale.

**Fire Extinguishing System (Chemical)**

1. Make, model, and type of fire extinguishing system.
2. Cylinder mounting location.
3. Type, size, and configuration of discharge piping.
4. Location and configuration of all ells, tees, and distributors.
5. Location and configuration of system actuating tubing.
6. Location and configuration of duct, plenum and surface discharge nozzles.
7. Location and number of flow restricting or balancing devices.
8. Location and type of cooking appliances and char-broilers.
10. Location and temperature rating of fusible links.
12. Location, make and model of automatic fuel shut-off device.
13. Location, make, and model of all reset relays.
Chapter 11
2012 IFC CODE ADOPTIONS AND AMENDMENTS

CHAPTER 1
ADMINISTRATION

Section 101.1 Title is amended as follows:
These regulations shall be known as the Fire Code of Central Arizona Fire and Medical Authority, hereinafter referred to as “this code”.

Section 105.6.2 Amusement building is amended as follows:
Amusement building and events. An operational permit is required for any amusement building or event.

Section 105.6.23 Hot work operations is amended as follows:
4. Hot work, including grinding, conducted within a wildfire risk area during burn restrictions.

Section 108.2 Limitations of authority is amended by adding:
Rulings by the Board of Appeals shall be binding upon the Fire Authority and the appellants. All rulings made by the Board of Appeals shall be only for the appellant and shall not be intended as a general change in this Code.

Section 109.4 Violation penalties is amended as follows:
Persons who violate a provision of this code or fail to comply with any of the requirements thereof, or who shall erect, install, alter, repair or perform work in violation of the approved construction documents or directive of the fire code official, or of a permit or certificate obtained under provisions of this Code, shall be found in violation and subject to penalties designated by the jurisdiction having authority.

Section 111.4 Failure to comply is amended as follows:
Any person who continues any work after having been served with a stop work order, except such work as that person is directed to perform to remove a violation or unsafe condition, shall be found in violation and subject to penalties designated by the jurisdiction having authority.

CHAPTER 5
FIRE SERVICE FEATURES

Section 505.1 Address identification is amended as follows:
New and existing buildings shall have approved address numbers, building numbers or building identification placed in a position that is plainly legible and visible from the street or road fronting the property. These numbers shall contrast with their background. Address numbers shall be Arabic numbers or alphabetical letters. Numbers shall be a minimum of 6 inches high with a minimum stroke width of 0.5 inch. Larger numbers may be required by the fire code official to facilitate emergency response.

Section 505.2.1 Conflicting road names is amended by adding a new section as follows:
Newly assigned street or road names shall not conflict with existing names and shall be approved by the fire code official.
CHAPTER 9
FIRE PROTECTION SYSTEMS

Section 901.2 Construction documents is amended by adding the following:
Automatic sprinkler system plans shall be submitted bearing a review certification and signature of a minimum level III NICET Certified Engineering Technician or Arizona registrant. Fire sprinkler plans for high-piled combustible storage occupancies shall require a registered fire protection engineer stamp. Fire alarm system plans shall be submitted bearing a review certification and signature of a minimum level III NICET Technician or Arizona registrant.

Section 901.6.2 Records is amended to read as follows:
Records of all system inspections, tests and maintenance required by the referenced standards shall be maintained on the premises for a minimum of three years and reports of system deficiencies shall be forwarded to the authority having jurisdiction within 10 business days.

Section 903.2.1.1 Group A-1 is amended by changing item 1 to read as follows:
1. The fire area is 5000 square feet or greater.

Section 903.2.1.3 Group A-3 is amended by changing item 1 to read as follows:
1. The fire area is 5000 square feet or greater.

Section 903.2.1.4 Group A-4 is amended by changing item 1 to read as follows:
1. The fire area is 5000 square feet or greater.

Section 903.2.3 Group E is amended as follows:
An automatic sprinkler system shall be provided for all Group E occupancies.
Exception: A day care facility with less than 11 children in a private residence.
Exception 2: In group E occupancies less than 5,000 s.f. where a municipal water supply is not available; if every classroom has at least one exterior exit door at ground level and an NFPA 72 compliant automatic fire alarm system installed throughout, fire sprinklers may be omitted if approved by the fire code official.

Section 903.2.4 Group F-1 is amended as follows:
Section 903.2.4 Group F An automatic sprinkler system shall be provided throughout all buildings containing Group F occupancies where one of the following conditions exists:
1. The fire area is 5000 square feet or greater.
2. The fire area is located more than two stories above grade.
3. A Group F occupancy used for the manufacture of upholstered furniture or mattresses exceeding 2,500 square feet.

Section 903.2.6 Group I is amended by changing exceptions 3 and 4 to read as follows:
3. An automatic sprinkler system is not required where day care facilities are at the level of exit discharge, where every room where care is provided has a least one exterior exit door and where the fire area is less than 5,000 square feet.
4. In buildings where Group I-4 day care is provided on levels other than the level of exit discharge, an automatic fire sprinkler system shall be installed through all levels of the building.

Section 903.2.7 Group M is amended by deleting item 3 and changing items 1 and 2 to read as follows:
1. The Group M fire area is 5000 square feet or greater.
2. The Group M fire area is located more than two stories above grade.
3. The combined area of all Group M fire areas on all floors, including any mezzanines, exceeds 5,000 square feet.

Section 903.2.7.1 High-piled storage is amended by adding:
The automatic fire sprinkler system shall be designed by a fire protection engineer.

Section 903.2.8 Group R is amended by adding exceptions 1 and 2 to read as follows:

Exception 1. Group R-3 less than 5,000 square feet unless more than two stories above grade. The calculated area shall include all livable and unfinished space, the area of any attached garage, and concealed or accessible spaces intended for storage use and/or future living space. All attached roofs and overhangs greater than 4 feet in width are included in the calculated area.

Exception 2. Group R-3 care facilities within a dwelling unit for five or fewer persons.

Section 903.2.9 Group S-1 is amended by changing Group S-1 to Group S and changing items 1, 2 and 3 to read as follows:

Section 903.2.9 Group S
1. The Group S fire area is 5,000 square feet or greater.
2. The Group S fire area is located more than two stories above grade.
3. The combined area of all Group S-1 fire areas on all floors, including any mezzanines, exceeds 5,000 square feet.

Section 903.2.9.1 Repair Garages is amended by changing items 1 and 2 to read as follows:

1. Buildings having two or more stories above grade plane, including basements, with a fire area containing a repair garage exceeding 5,000 square feet.
2. Buildings no more than one story above grade plane, with a fire area containing a repair garage exceeding 5,000 square feet.

Section 903.2.10 Group S-2 enclosed parking garages is amended by changing item 1 to read as follows:

1. Where the fire area of the enclosed parking garage exceeds 5,000 square feet.

Section 903.2.13 Group B is amended by adding the following section:
An automatic sprinkler system shall be provided throughout all buildings containing a Group B occupancy where one of the following conditions exist:

1. Where a Group B fire area is 5,000 square feet or greater.
2. Where a Group B fire area is located more than two stories above grade.

Section 903.2.14 Group U is amended by adding the following section:
An automatic sprinkler system shall be provided throughout all buildings containing a Group U occupancy 5,000 square feet or greater as determined by the fire code official.

Section 903.3.1.1.1 Exempt Locations is amended by deleting item number 4.

Section 903.3.1.3.1 Garages is amended by adding the following section:
Sprinklers are required in all attached garages and workshops.

Section 903.3.5 Water supplies is hereby amended by adding:

The water data for hydraulic calculations shall be based upon 85 percent of the available water supply as determined by flow test information.
CHAPTER 11
CONSTRUCTION REQUIREMENTS FOR EXISTING BUILDINGS

Section 1103.5 Sprinkler systems is amended by adding the following subsections:

**Section 1103.5.3 Building Addition.** A sprinkler system is required throughout the building when any addition increases the total floor area to 5,000 square feet or greater.

   Exception: R-3 Occupancies.

**Section 1103.5.4 Change of Use.** A sprinkler system is required throughout the building when any change of use or occupancy occurs to a portion of the building to a more hazardous occupancy or as determined by the Fire Code Official.

**Section 1103.5.5 Group A-1, A-3, and A-4 Addition.** A sprinkler system is required throughout the building when any addition to existing assembly occupancies increases the occupant load to more than 300.

**Section 1103.5.6 Group A-2 Addition.** A sprinkler system is required throughout the building when any addition to existing assembly occupancies increases the occupant load to more than 100.

**Section 1103.5.7 Group E.** A sprinkler system is required throughout the building for Group E occupancies.

   Exception: Child day care facilities for more than five but no more than 10 children in a single-family residence.

**Section 1103.5.8 Group R-3 Care Facilities.** A sprinkler system is required throughout the building in a single-family residence wherein six or more persons receive care.

**Section 1103.5.9 Vacant Buildings.** A sprinkler system is required throughout the building when any A, E, or I occupancy that has been vacant for more than 18 months requests to resume as the same occupancy classification.

**Section 1103.5.10 Fire Wall Breech.** A sprinkler system is required throughout the building when any modification or alteration to an existing building, with a total floor area of 5,000 square feet or greater, breeches or removes a required fire rated wall assembly.

**Section 1103.7 Fire Alarm Systems** is amended by adding the following subsections:

**Section 1103.7.8 Non-Monitored Sprinkler System.** A fire alarm system shall be installed throughout the building when an existing, non-monitored fire sprinkler system is modified by 20 or more sprinkler heads.

**Section 1103.7.9 Sprinkled Building Fire Alarm Requirement.** An approved fire alarm system shall be installed in existing buildings when a fire sprinkler system is provided.

CHAPTER 56
EXPLOSIVES AND FIREWORKS

Section 5601.2.4 Financial Responsibility is amended as follows:

Before a permit is issued, as required by Section 5601.2, the applicant shall file with the jurisdiction a corporate surety bond in the principal sum of $1,000,000 (one million dollars) or a public liability insurance policy for the same amount, for the purpose of the payment of all damages to persons or property which arise from, or are caused by, the conduct of any act authorized by the permit upon which any judicial judgment results. The fire code official is authorized to specify a greater or lesser
amount when, in his or her opinion, conditions at the location of use indicate a greater or lesser amount is required. Government entities shall be exempt from this bond requirement.

**Section 5601.2.4.1 Blasting** is amended as follows:

Before approval to do blasting is issued, the applicant for approval shall file a bond or submit a certificate of insurance in the amount of $1,000,000 (one million dollars) in each case to indemnify the jurisdiction against any and all damages arising from permitted blasting.

**Section 5601.2.4.2 Fireworks Display** is amended as follows:

Before approval for a display is issued, the permit holder shall furnish a bond or certificate of insurance in the amount of $1,000,000 (one million dollars) per occurrence for the payment of all potential damages to a person or persons or to property by reason of the permitted display, and arising from any acts of the permit holder, the agent, employees or subcontractors to indemnify the jurisdiction against any and all damages arising from permitted fireworks displays.

**Chapter 80**

**Referenced Standards**

**Part VI-Referenced Standards** is amended to add the following:
Add the document known as Central Arizona Fire and Medical Authority “Fire Protection Standards” for Builders, Developers, Engineers & Architects.

**APPENDIX A**

**Section A101.2 Membership** is amended as follows:

The membership of the board shall consist of five voting members having the qualifications established by this section and reside within the boundaries of the Central Arizona Fire and Medical Authority. In the event that it is not practical to find members as required by this section, the Fire Code official reserves the right to relax the qualifications as to create a valid professional board to serve this jurisdiction. Prospective members shall apply to the Fire Marshal of the jurisdiction, subject to confirmation by a majority vote of the Central Arizona Fire and Medical Authority Fire Board. Members shall serve without remuneration or compensation, and shall be removed from office prior to the end of their appointed terms only for cause.

**Section A101.3 Terms of Office** is deleted.

**Section A101.3.1 Initial Appointments** is deleted.

**Section A101.5 Secretary of Board** is amended as follows:

The fire code official or designee shall act as Secretary of the Board and shall keep a detailed record of all its proceedings, which shall set forth the reasons for its decisions, the vote of each member, the absence of a member, and any failure of a member to vote.

**APPENDIX B**

**Table B105.1 Minimum Required Fire Flow and Flow Duration for Buildings** is amended by adding Footnote c as follows:

Footnote c: In special circumstances, where the municipal or rural water supply will not provide the required 1500 gpm, the fire code official may accept a lesser amount. This amount shall never be less than 1000 gpm.
APPENDIX D

Section D103.2 Grade is amended as follows:

Fire apparatus access roads shall not exceed 12 percent grade.
The exception is deleted and replaced as follows:
Exception: The fire code official may permit the access road grade to increase, but shall not exceed 15 percent if fire sprinkler protection is installed.

Section D103.3 Turning Radius is amended as follows:

The minimum turning radius shall be 28’ (twenty eight feet) inside and 50’ (fifty feet) outside diameter for all fire department access roads and parking lots.

Table D103.4 is amended to read as follows:
In lieu of the required 96-foot diameter, a cul-de-sac with an 82-foot diameter drivable surface with no parking signs posted throughout may be allowed if approved by the fire code official.
